

Geographic areas where *P. annularis* are found

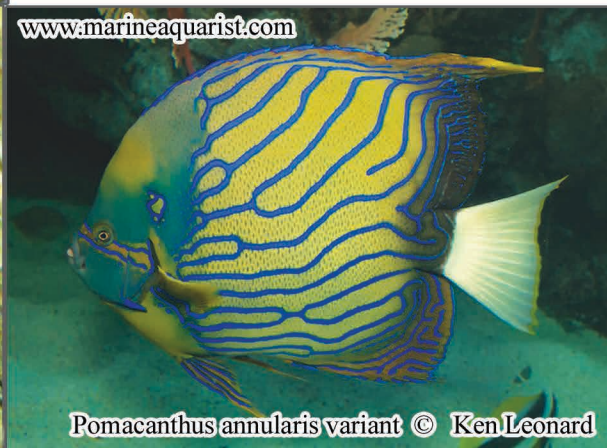

The common name of the “Blue Ring Angelfish” was given due to its blue circle or ring found behind the eye and above the pectoral fin (Del Prete 1974).

Fish in the *Pomacanthus* genus usually have a harem mating system, where one male defends a territory with two to six females. *Pomacanthus annularis* in adolescent and adult sizes must be kept in aquariums of about 150-250 gallons / 575-1000 liters. These fish flourish at a temperature of about 77° F / 26° C with a salinity of 35 ppt. & a specific gravity of 1.026.

*Pomacanthus annularis* requires plenty of swimming room and hiding places in the aquarium. They have been observed nipping at sessile invertebrates, such as corals, clams and nudibranches. Thus, the *Pomacanthus annularis* is not a good choice for inclusion in a reef type (live coral) aquarium. ♦
